## **HISTORICAL DEVELOPMENT OF THE DEVELOPED HOUSE OF PSYCHOLOGICAL CONSULTATION IN THE HOUSE OF HEALTH – BITOLA**

Lence Ilievska, Domnika Rajcanovska  
Preventive protection of newborn infant, young and pre-school child,  
House of Health Bitola

**Introduction:** The developed house of consultation in Bitola in juncture with the Department for Preventive protection of children has begun working in 1986. Since then, in the community of Bitola is attended the psycho-motory progress of all newborn children, and a special retrospection is put on children born with a factor of risk. There is a team job combined of two pediatricians, three psychologists and one defectologist.

**Materials and methods:** A regular systematic control is made on every child of age three to five years, while children who are born with a factor of risk are attended on six months. The psychological diagnostically techniques which are used for an estimation of the psycho-motor development are the following: Psychological interview, RTC – M

(developed test for young children). SPP – 3 (systematic psychological control), Progressive matrixes, Revise (scale of intelligence), THP (projective test).

**Aim:** Early psychological diagnostics and early intervention for children who are born with a factor of risk, as far as attending of the psycho-motory development of children on age of three to five years, appropriate treatment and consultation for all psychical and psycho-motonal problems between children.

**Results:** In the period from 1986 – 2007 are made psychological tests on 30 000 children. Interventions are made accurately for all children wherever is noticed that there are difficulties in the intellectual and psycho-motonal development, problems in speech, Pervasive dispersion ( children's autism, atypical autism, Rett syndrome, Asperger syndrome etc. ), hyper-chynetical dispersion, emotional dispersion, dispersal in the social functioning ( mutations, tics, disarray, dispersion in the sphere of instinct: nonorganic enurezis and nonorganic incoprezis), nutrition dispersion and many other children's psychological difficulties.

**Conclusion:** The early psychological diagnostic and the early teamwork intervention among the youngest children are very important for harmonious psycho-motonal development and prevention of all the psychical difficulties which appear among infants.

**Key words:** Developed house of consultation, psychological tests, systematic control.
